

MEETING THE PROJECT MANAGEMENT CHALLENGE

2004

Abstract

“Cost/Schedule Analysis Using wlnsight”

Nicholas Pisano

A difficult challenge that confronts program managers as they select their PM tools today is the need for program stakeholders to get an accurate view of program performance across an individually capable but often-disparate “best of breed” planning and product support tool set emanating from different sources. This presentation will demonstrate the scalability and integration functionality of the wlnsight tool suite from its use as a desktop and LAN-based cost and schedule analysis tool to its ability to serve as the first PM solution to leverage modern XML and Web Services technologies in a way that embraces the realities of the program management environment and the diversity of the tools and networking environments that need to be seamlessly integrated for total program performance management. This presentation will focus on how these applications and digital dashboards are being implemented today in many industry settings and how wlnsight and wlnsight Web technology is the backbone to any program management solution.
